

## Clinical Study Synopsis for Public Disclosure

This clinical study synopsis is provided in line with **Boehringer Ingelheim's Policy on Transparency and Publication of Clinical Study Data**.

The synopsis - which is part of the clinical study report - had been prepared in accordance with best practice and applicable legal and regulatory requirements at the time of study completion.

The synopsis may include approved and non-approved uses, doses, formulations, treatment regimens and/or age groups; it has not necessarily been submitted to regulatory authorities.

A synopsis is not intended to provide a comprehensive analysis of all data currently available regarding a particular drug. More current information regarding a drug is available in the approved labeling information which may vary from country to country.

Additional information on this study and the drug concerned may be provided upon request based on **Boehringer Ingelheim's Policy on Transparency and Publication of Clinical Study Data**.

The synopsis is supplied for informational purposes only in the interests of scientific disclosure. It must not be used for any commercial purposes and must not be distributed, published, modified, reused, posted in any way, or used for any other purpose without the express written permission of Boehringer Ingelheim.

<b>Title of trial:</b>	An open-label, randomized, crossover relative bioavailability study of a new soft gelatin capsule formulation of BI 201335 NA compared to the current solution formulation (powder in bottle (PIB)), after single dose oral administration in healthy volunteers			
<b>Principal/Coordinating Investigator:</b>	[REDACTED]			
<b>Trial sites:</b>	[REDACTED]			
<b>Publication (reference):</b>	Data from this study has not been published			
<b>Clinical phase:</b>	I			
<b>Objectives:</b>	The objective of this study was to establish the relative bioavailability of a new soft gelatin capsule (SGC) formulation of BI 201335 NA compared to the current solution formulation (powder in bottle, PIB) for two doses (40 mg, 240 mg) in a parallel, two-way cross-over study design.			
<b>Methodology:</b>	Open-label, randomised, two-way crossover design

<b>Criteria for evaluation:</b>				
<b>Efficacy / clinical pharmacology:</b>		Pharmacokinetic parameters: Primary endpoints: Comparison of plasma AUC <sub>0-∞</sub> and C <sub>max</sub> between the same dose and two different drug formulations to determine relative bioavailability of BI201335 NA soft gelatin capsule formulation compared to the solution formulation.  Key secondary endpoint included comparisons of t <sub>max</sub> , AUC <sub>0-tz</sub> , t <sub>1/2</sub> and CL/F between same dose and the two different drug formulations.  Other secondary pharmacokinetic parameters, λ <sub>z</sub> , MRT <sub>po</sub> , V <sub>z</sub> /F, and C <sub>24</sub> were included as needed in comparisons between same dose and two different drug formulations of BI 201335 NA.		
<b>Safety:</b>		Vital signs (blood pressure, pulse rate), laboratory tests, adverse events		
<b>Statistical methods:</b>		Geometric mean ratios and corresponding 90% confidence intervals were calculated for all pharmacokinetic parameters, and pairwise comparisons were made between groups receiving solution formulation versus soft gelatin capsule formulation of BI201335.  Descriptive statistics for all other parameters were calculated.		
<b>SUMMARY – CONCLUSIONS:</b>				
<b>Efficacy / clinical pharmacology results:</b>		Relative bioavailability (gMean) of BI 201335 NA SGC when compared to the PIB formulation for the 40 mg dose was: AUC <sub>0-∞</sub> 92.2% (CI: 81.7%-104.1%), C <sub>max</sub> 87.2% (CI: 78.7%-96.6%), and for the 240 mg dose was: AUC <sub>0-∞</sub> 70.5% (CI: 58.1-85.4%), C <sub>max</sub> 59.5% (CI: 44.2%-80.1%). The key secondary endpoint time to C <sub>max</sub> (t <sub>max</sub> ) was increased at the 240 mg dose level for the SGC formulation (gMean / gCV[%]) to 5.56 hours/28.2%, when compared to t <sub>max</sub> of 3.6 hours/28.8% for the PIB formulation. Consistent with previous observation, systemic drug exposure increased supra-proportionately with dose. Each dose group included equal (1:1) male and female subjects, and PK parameters of BI 201335 NA were similar between genders. Inter-subject variability was higher with the 240 mg dose compared with the 40 mg dose, regardless of oral formulation.		

<b>Name of company:</b> Boehringer Ingelheim		<b>Tabulated Trial Report</b>		 <b>Boehringer Ingelheim</b>  <b>Synopsis No.:</b>
<b>Name of finished product:</b> N/A		<b>EudraCT No.:</b>		
<b>Name of active ingredient:</b> BI 201335 NA		<b>Page:</b> 4 of 4		
<b>Module:</b>		<b>Volume:</b>		
<b>Report date:</b> 24 December 2008	<b>Trial No. / U No.:</b> 1220.10 / U08-3427-01	<b>Date of trial:</b> 14 January 2008 to 25 February 2008	<b>Date of revision (if applicable):</b>

<b>Safety results:</b>	No serious adverse events were observed. Consistent with previous observations, most frequent adverse events (AEs) associated with BI201335 NA included gastrointestinal (nausea, diarrhea) and CNS (headache) organ system. All AEs were of mild to moderate intensity, regardless of oral formulation and were resolved by end of the study. Frequency of AEs was higher in the 240 mg dose group when compared to 40 mg dose group. Mild, asymptomatic and reversible indirect hyperbilirubinemia was observed in eight (40%) subjects in the 240 mg dose group, all of whom had non wild-type UGT1A1 genotypes and consistent with reduced enzyme activity.			
<b>Conclusions:</b>	Taken together, the relative bioavailability (BA) of BI201335 NA SGC formulation was dependent on dose. Relative BA of a single 40 mg dose SGC formulation was similar to that of a single 40 mg dose PIB formulation, and reduced by approximately 30-40% for a single 240 mg dose SGC formulation when compared to a single 240 mg dose PIB formulation. Time to C <sub>max</sub> (t <sub>max</sub> ) was increased in the median by 2 hours following a single 240 mg dose with the SGC formulation when compared to the PIB formulation.
